

Full Width Landing Entrances

Benefits to Constructors:

- Speeds up completion of communal areas, the area of intense activity by many trades during the latter stage of the building completion.
- Prevents damage from building materials falling down into shaft onto lift equipment.
- Removes risk of distortion of lift architraves by other trades when making good.
- Reduces the need for daywork by lift engineer to gain access and move the lift up and down to fire line inside of shaft entrances.
- E120 (2-hour fire rated) replacing time consuming site construction whilst achieving fire return walls.
- Provides immediate full width entrance protection once landing doors are fitted, improving health and safety on each landing.
- Reduces management time, removes the need to stop installing, and then return to site after entrances have been “built in”.
- The lift Installation and testing can be one continuous process.
